Pericyclic Reactions 1: Cycloadditions

For each of the following "Diels-Alder-like" reactions, draw the curved-arrow mechanism.

Why do some reactions happen and others don't? Look at the *frontier molecular orbitals...*

Cycloadditions:

[2s + 2s]

Consider the following seemingly plausible reaction. Why doesn't it happen?

How can we make it happen? Change the frontier orbitals!

Thus, we observe that [2s + 2s] cycloadditions are **thermally forbidden** but **photochemically allowed.**

Cycloadditions:

[2s + 2a]

Having said that [2s + 2s] cycloadditions are thermally forbidden, how can we explain the following *observed* reaction?

What are the requirements for antarafacial cycloadditions?

Cycloadditions: Putting it Together

Summarize the selection rules for cycloadditions:

Now analyze the following cycloadditions:

Pericyclic Reactions 2: Electrocyclic Ring-Closing & Ring-Opening

Show the curved arrows for the following electrocyclic reactions:

How can we explain the stereochemistry? Look at the frontier molecular orbitals!

Electrocyclic Ring-Closing: 6 Electrons, Thermal

$$CH_3$$
 CH_3
 CH_3

Electrocyclic Ring-Closing: 8 Electrons, Thermal

Electrocyclic Ring-Opening: 4 Electrons, Thermal

$$CH_3$$
 CH_3
 CH_3
 CH_3

Electrocyclic Ring-Closing: 4 Electrons, Photochemical

Electrocyclic Reactions: Putting It Together

Summarize the *selection rules* for electrocyclic reactions:

Pericyclic Reactions 3:Sigmatropic Rearrangements

Show the curved arrows for the following reactions:

$$CH_3$$
 CH_3 + CH_3

Sigmatropic Rearrangements:

[1,n] & Stereochemistry

The following rearrangement is *suprafacial*. Why?

$$CH_3$$
 CH_3 + CH_3

The following rearrangement is antarafacial. Why?

$$D$$
 CH_3 D CH_3

Sigmatropic Rearrangements:

MOs in [3,3] rearrangements

How can we understand the orbitals involved in the following rearrangements?

The Cope Rearrangement:

$$\begin{array}{c} \Delta \\ \hline \end{array}$$

The Claisen Rearrangement:

Sigmatropic Rearrangements: Putting it Together

Summarize the *selection rules* for sigmatropic rearrangements:

Let's examine the biosynthesis of Vitamin D. Why is sunlight required?

$$\begin{array}{c} \text{Me} \\ \text{H} \\ \text$$
